People

Lecturer
- Prof. Dr. Thomas Seidl

Assistants
- Max Berrendorf
- Julian Busch

Student Assistants
- Maximilian Hünemörder
- Florentin Schwarzer
### Schedule

#### Lecture (begins: 16.10.2018)

<table>
<thead>
<tr>
<th>Day</th>
<th>Time</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tu.</td>
<td>09:15-11:45</td>
<td>B U101 (Oettingenstraße. 67)</td>
</tr>
</tbody>
</table>

#### Tutorials (begin: 25.10.2018)

<table>
<thead>
<tr>
<th>Day</th>
<th>Time</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Th.</td>
<td>12:15-13:45</td>

</tbody>
</table>

### Exam

1. **Hauptklausur:**
   - Mo., 25.02.19, 14:00-16:00, B 101 B 201 (Hauptgebäude)

2. **Nachholklausur:**
   - tba
Material, Tutorials & Exam

Material (Slides, Exercises, etc.)

Available on course webpage:

http://www.dbs ifi.lmu.de/cms/studium_lehre/lehre_master/kdd1819/index.html

Tutorial

- Python Introduction now available on website
- First exercise sheet available for download around 18.10.2018
- Prepare at home
- Presentation and discussion one week after

Exam

- Written exam at the end of semester
- All material discussed in the lecture and tutorials
- Registration via UniWorX
Content of this Course

1. Introduction
   1.1 Organisation
   1.2 Motivation
   1.3 Knowledge Discovery Process

2. Basics
   2.1 Data Representation
   2.2 Data Reduction
   2.3 Visualization
   2.4 Privacy

3. Unsupervised Methods
   3.1 Frequent Pattern Mining
   3.2 Clustering
   3.3 Outlier Detection

4. Supervised Methods
   4.1 Classification
   4.2 Regression

5. Advanced Topics
   5.1 Process Mining
   5.2 Outlook
Textbook / Acknowledgements

Motivation

Data Mining = extraction of patterns from data

Patterns
- Regularities – examples: frequent itemsets, clusters
- Irregularities – examples: outliers

Not all patterns are useful
- "all mothers in our database are female" \(\rightarrow\) trivial/known
- "bread, butter is frequent" given "bread, butter, salt is frequent" \(\rightarrow\) redundant

Aggregation of data may help: Basic statistics
Knowledge Discovery in Databases (Data Mining)

Extraction of interesting *(non-trivial, implicit, previously unknown and potentially useful)* information or patterns from data in *large databases*

Roots of Data Mining

- Statistics
- Machine Learning
- Database Systems
- Information Visualization
Data Mining: Motivation

"Necessity is the mother of invention"

Data Explosion Problem

Tremendous amounts of data caused by

▶ Automated data collection
▶ Mature database technology

"We are drowning in data, but starving for knowledge!"

Solution

▶ Data Warehousing and on-line analytical processing (OLAP)
▶ Data Mining: Extraction of interesting knowledge (rules, regularities, patterns, constraints) from data in large databases
Stairs of Knowledge (K. North) ¹

Data Mining: Potential Applications

- Database analysis and decision support
  - *Market analysis and management:*
    target marketing, customer relation management, market basket analysis, cross selling, market segmentation
  - *Risk analysis and management:*
    Forecasting, customer retention ("Kundenbindung"), improved underwriting, quality control, competitive analysis
  - *Fraud detection and management*

- Other Applications:
  - Text mining (news group, email, documents) and Web analysis.
  - Intelligent query answering
The Knowledge Discovery Process

▶ The KDD-Process (Knowledge Discovery in Databases)

Data Cleaning, Data Integration  ➔ "Data Warehouse"  ➔ Transformation, Selection, Projection  ➔ Task-relevant data  ➔ Data Mining  ➔ Patterns  ➔ Visualization, Evaluation  ➔ Knowledge

Data Mining:

▶ Frequent Pattern Mining
▶ Clustering
▶ Classification
▶ Regression
▶ Process Mining
▶ …
KDD Process: Data Cleaning & Integration

- ...may take 60% of effort
- Integration of data from different sources
  - Mapping of attribute names, e.g. C Nr → 0 Id
  - Joining different tables, e.g. Table1 = [C Nr, Info1] and Table2 = [0 Id, Info2]
    → JoinedTable = [0 Id, Info1, Info2]
- Elimination of inconsistencies
- Elimination of noise
- Computation of missing values (if necessary and possible): Possible strategies e.g. default value, average value, or application specific computations
KDD Process: Focusing on Task-Relevant Data

<table>
<thead>
<tr>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>▶ Find useful features, dimensionality/variable reduction, invariant representation</td>
</tr>
<tr>
<td>▶ Creating a target data set</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Selections</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select the relevant tuples/rows from the database tables, e.g., sales data for the year 2001</td>
</tr>
</tbody>
</table>
KDD Process: Focusing on Task-Relevant Data

Projections

Select the relevant attributes/columns from the database tables, e.g., \((id, \text{name, date, location, amount}) \mapsto (id, \text{date, amount})\)

Transformations, e.g.:

- Discretization of numerical attributes, e.g.,
  \(\text{amount: [0, 100]} \mapsto \text{d_amount: \{low, medium, high\}}\)
- Computation of derived tuples/rows and derived attributes:
  - aggregation of sets of tuples, e.g., total amount per months
  - new attributes, e.g., \(\text{diff} = \text{sales current month} - \text{sales previous month}\)
KDD Process: Basic Data Mining Tasks

Goal
Find patterns of interest

Tasks

▶ Identify task: Are there labels (in the training data)?
  ▶ Many $\leadsto$ Supervised learning (focus on given concepts)
  ▶ Some few $\leadsto$ Semi-supervised learning (focus on few hidden concepts)
  ▶ None $\leadsto$ Unsupervised learning (many hidden concepts)

▶ Choose fitting mining algorithm(s)
Basic Mining Tasks: Frequent Itemset Mining

Setting

<table>
<thead>
<tr>
<th>Transaction ID</th>
<th>Items Bought</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000</td>
<td>A,B,C</td>
</tr>
<tr>
<td>1000</td>
<td>A,C</td>
</tr>
<tr>
<td>4000</td>
<td>A,D</td>
</tr>
<tr>
<td>5000</td>
<td>B,E,F</td>
</tr>
</tbody>
</table>

Given a database of transactions, e.g.

Motivation

Frequently co-occurring items in the set of transactions indicate correlations or causalities

Examples

- buys(x, "diapers") ⇒ buys(x, "beers") [supp: 0.5%, conf: 60%]
- major(x, "CS") ∧ takes(x, "DB") ⇒ grade(x, "A") [supp: 1.0%, conf: 75%]
Basic Mining Tasks: Frequent Itemset Mining

Applications

- Market-basket analysis
- Cross-marketing
- Catalogue design
- Also used as a basis for clustering, classification
- Association rule mining: Determine correlations between different itemsets
## Basic Mining Tasks: Clustering

### Setting
- Database of objects
- (Dis-)Similarity function between objects
- Unknown class labels

### Task
Group objects into sub-groups (clusters) 
"maximizing" intra-class similarity and 
"minimizing" interclass similarity
Basic Mining Tasks: Clustering

<table>
<thead>
<tr>
<th>Applications</th>
</tr>
</thead>
<tbody>
<tr>
<td>▶ Customer profiling/segmentation</td>
</tr>
<tr>
<td>▶ Document or image collections</td>
</tr>
<tr>
<td>▶ Web access patterns</td>
</tr>
<tr>
<td>▶ ...</td>
</tr>
</tbody>
</table>
Basic Mining Tasks: Classification

Setting
Class labels are known for a small set of "training data"

Task
Find models/functions/rules (based on attribute values of the training examples) that
▶ describe and distinguish classes
▶ predict class membership for "new" objects
Basic Mining Tasks: Classification

Applications

- Classify disease type for tissue samples from gene expression values
- Automatic assignment of categories to large sets of newly observed celestial objects
- Predict unknown or missing values (cf. KDD data cleaning & integration)
- ...
Basic Mining Tasks: Regression

Setting

Numerical output values are known for a small set of "training data"

Task

Find models/functions/rules (based on attribute values of the training examples) that

- describe the numerical output values of the training data
- predict the numerical value for "new" objects
Basic Mining Tasks: Regression

Applications

- Build a model of the housing values, which can be used to predict the price for a house in a certain area
- Build a model of an engineering process as a basis to control a technical system
- ...
Basic Mining Tasks: Generalization Levels

- Generalize, summarize, and contrast data characteristics
- Based on attribute aggregation along concept hierarchies
  - Data cube approach (OLAP)
  - Attribute-oriented induction approach
## Basic Mining Tasks: Other Methods

### Outlier Detection
Find objects that do not comply with the general behaviour of the data (fraud detection, rare events analysis)

### Trends and Evolution Analysis
Sequential patterns (find re-occurring sequences of events)

### Methods for special data types, and applications
- Process Mining
- Spatial Data Mining
- Graphs
- ...
KDD Process: Evaluation and Visualization

➤ Pattern evaluation and knowledge presentation: Visualization, transformation, removing redundant patterns, etc.

➤ Integration of visualization and data mining:
  ➤ data visualization
  ➤ data mining result visualization
  ➤ data mining process visualization
  ➤ interactive visual data mining

➤ Different types of 2D/3D plots, charts and diagrams are used, e.g. box-plots, trees, scatterplots, parallel coordinates

➤ Use of discovered knowledge
Summary

- Data mining = Discovering interesting patterns from large amounts of data
- A natural evolution of database technology, machine learning, statistics, visualization, in great demand, with wide applications
- A KDD process includes data cleaning, data integration, data selection, transformation, data mining, pattern evaluation, and knowledge presentation
- Data mining functionalities: characterization, discrimination, association, classification, clustering, outlier and trend analysis, etc.
