

Contributions

- ITCH – a new hierarchical clustering approach on top of the idea of data compression which yields numerous advantages:
- ❖ All single clusters as well as their hierarchical arrangement are guaranteed to be **meaningful**.
- ❖ Each cluster is represented by an **intuitive description** of its content in form of a Gaussian PDF.
- ❖ **Outliers** are assigned to the root of the cluster hierarchy or to an appropriate inner node, depending on the degree of outlierness.
- ❖ ITCH is **fully automatic** as no difficult parameter settings are necessary.

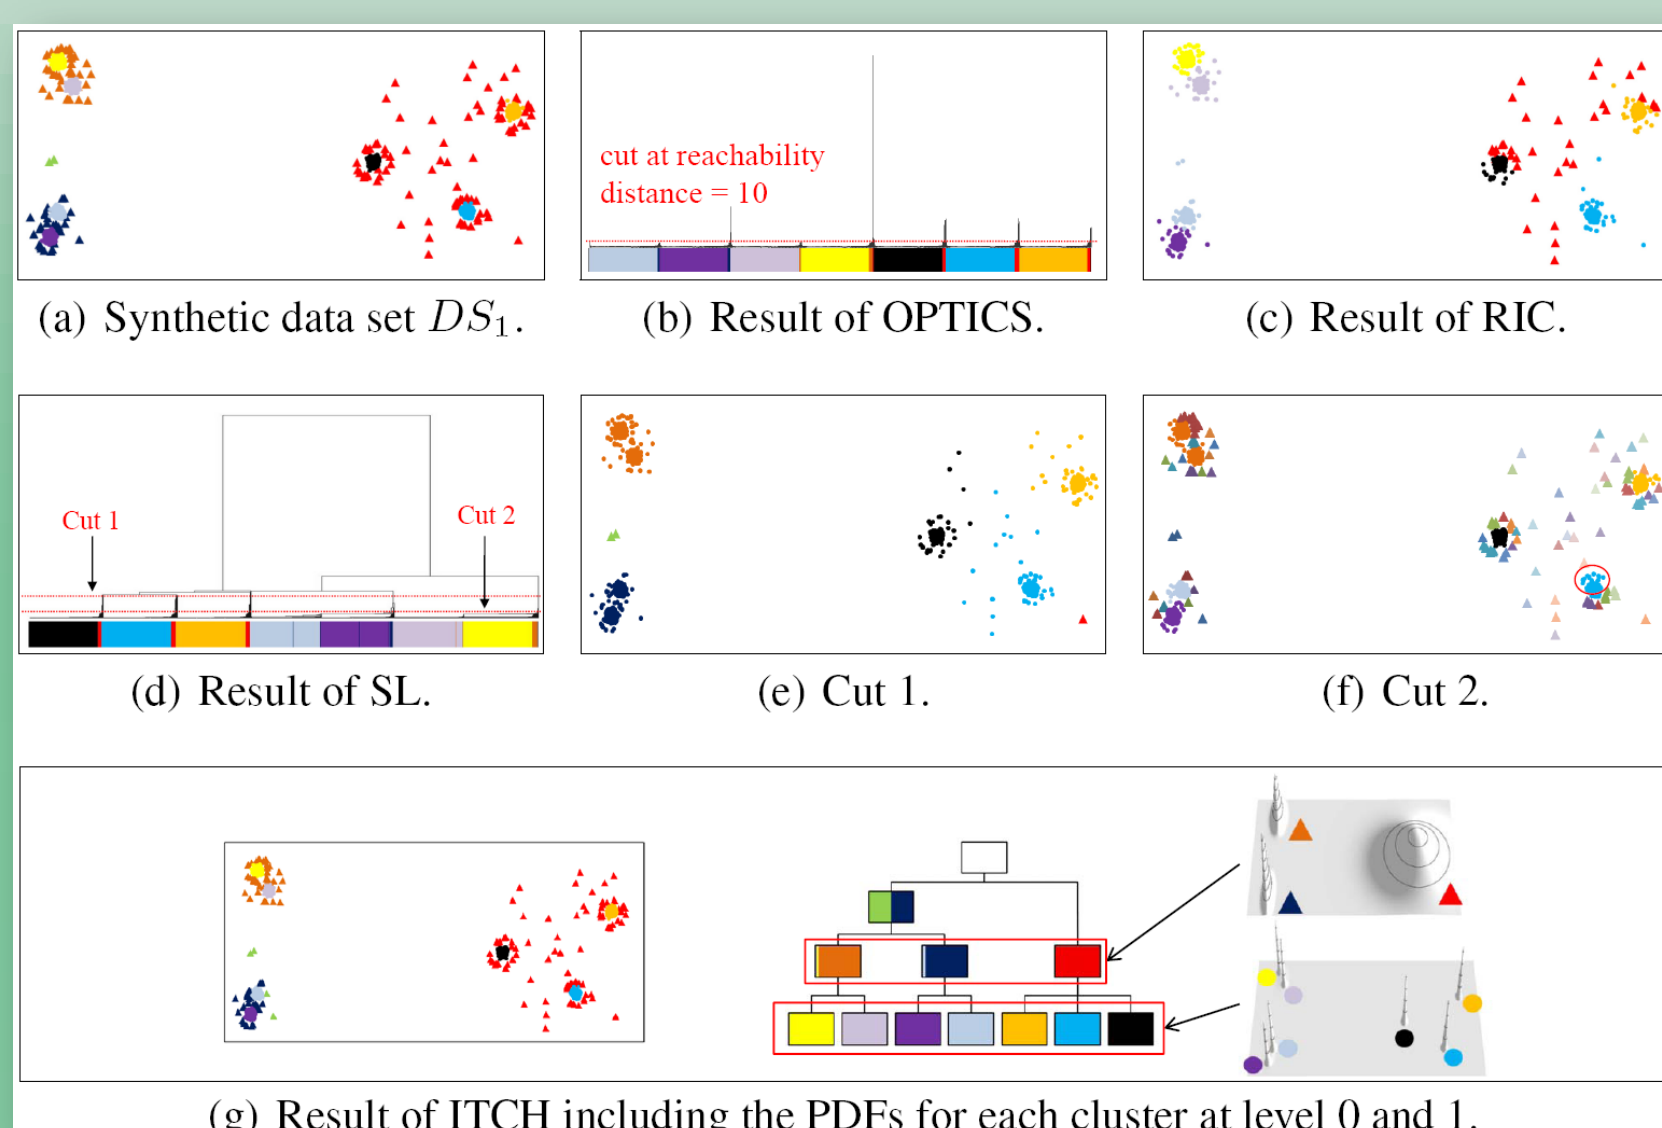

hMDL: A MDL principle for hierarchical cluster structures

$$C_{\text{data}} = -\sum_{C \in \mathcal{N}} \left(nW_C \log_2 W_C + \sum_{x \in C} \sum_{1 \leq j \leq d} \log_2 N(\mu_{C,j}, \sigma_{C,j}^2, x_j) \right)$$

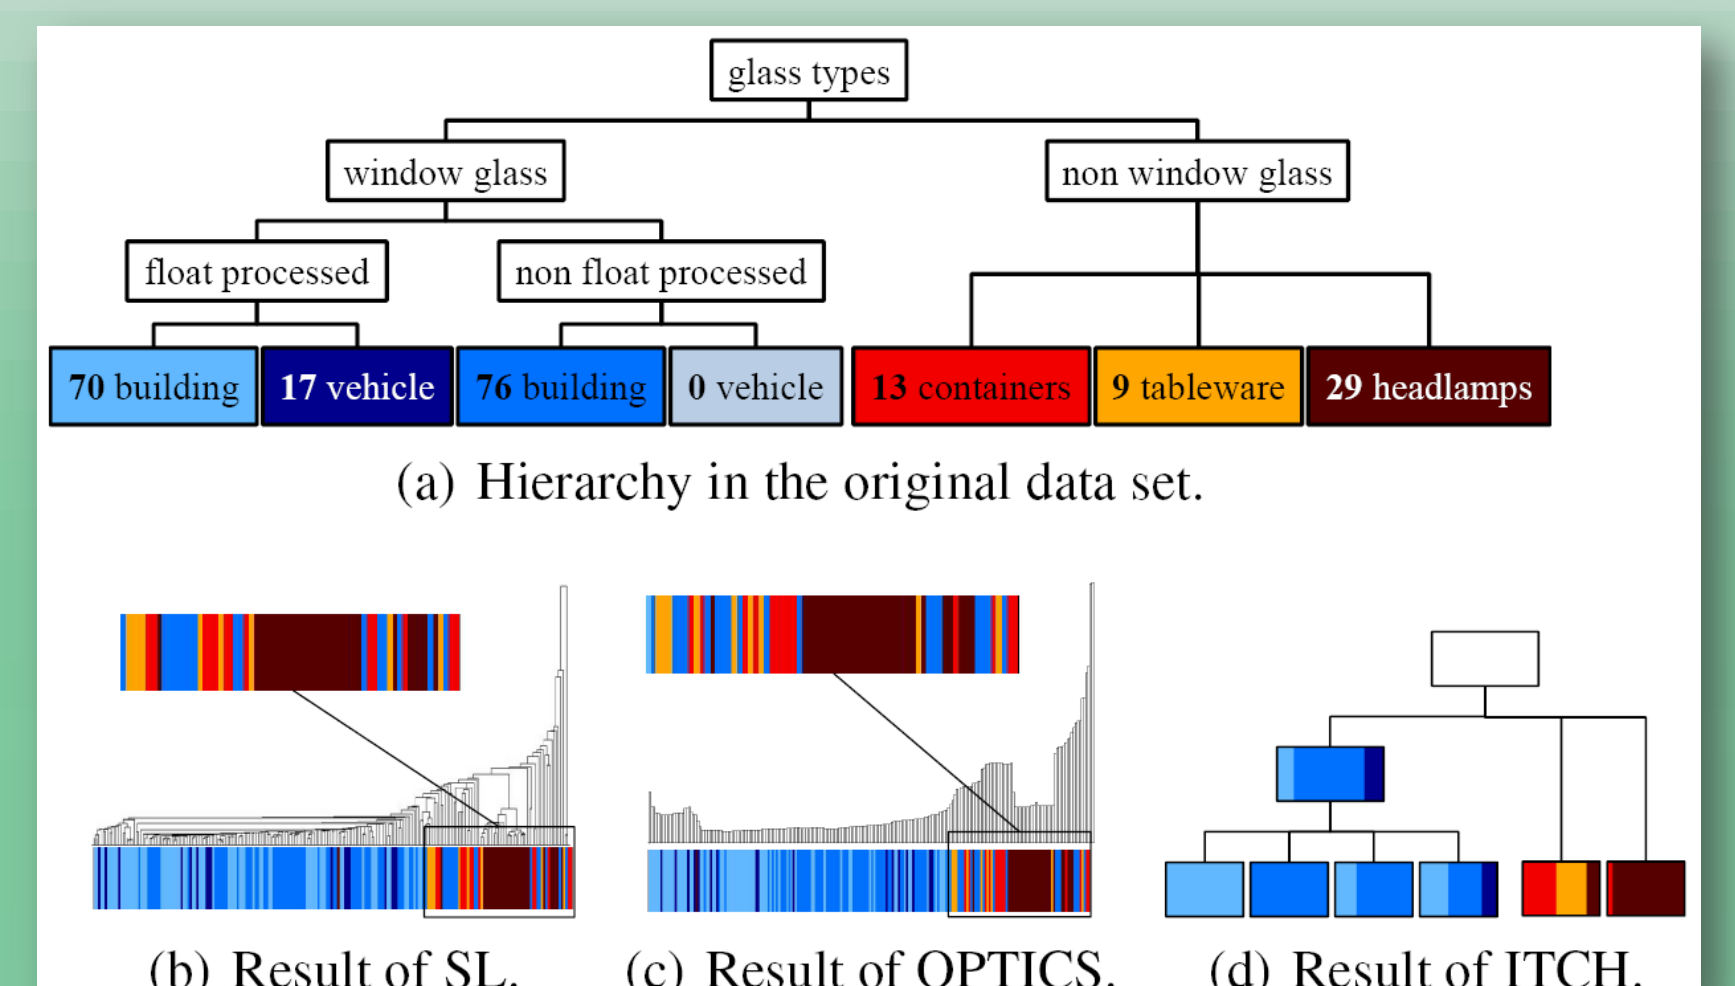

$$hMDL = \sum_{C \in \mathcal{N}} \left(C_{hMDL}(C) - nW_C \log_2(W_C) - \log_2 \left(\sum_{x \in \text{parent of } C} W_x \right) \right)$$

Experimental Evaluation

Synthetic
dataset DS_1

	Precision	Recall
OPTICS	94.8%	95.4%
RIC	94.9%	92.2%
SL (Cut 1)	70.0%	85.9%
SL (Cut 2)	8.5%	9.0%
ITCH	93.8%	97.5%

„Glass“dataset

Synthetic
dataset DS_2

	Precision	Recall
RIC	50.0%	100.0%
ITCH	99.2%	99.7%

„Cancer“dataset
